

## 1.0 Out-of-Box and Prior to Final Installation

- 1.1. Verify that you have received all of the parts listed on the *Installation Quick Reference* placemat.
- 1.2. Download the current manual, otherwise known as an *Operation Guide*, which is available in the **Downloads** tab at the following webpage:  
<http://www.cyberdata.net/voip/011306/>

**Note** You can also navigate to the **Downloads** tab by going to [www.CyberData.net](http://www.CyberData.net) and following the steps that are indicated by the following figures:

## 2.0 Select Power Source

PoE Switch	PoE Injector
Set PoE power type to Class 0 = 15.4W	CAT6 cable recommended— for longer distances
	Be sure you are using a non-PoE switch or port
Make sure port is not in trunk mode	
Set port to full duplex/ 100Mbps	

---

## 3.0 Power Test

- 3.1. Plug in the CyberData device and monitor the LED activity above the ethernet port on the back of the Intercom. See the following figure:

- 3.2. The green **100Mb Link** LED blinks off once during the boot up process when the device begins DHCP addressing and autoprovisioning attempts, and then comes on again and remains constant (solid green). The yellow **Link/Activity** LED may be blinking depending on the network activity.

During the initialization process, the Call Button LED should come on solid. It will then blink 10 times per second until it can find a network address and attempt autoprovisioning. This can take from 5 to 60 seconds. When the device has completed initialization, the Call Button LED will blink twice and then remain solid.

**Note** The default DHCP addressing timeout is 60 seconds. The device will attempt DHCP addressing 12 times with a 3 second delay between tries and eventually fall back to the programmed static IP address (by default 10.10.10.10) if DHCP addressing fails. The DHCP Timeout is configurable in the device's Network settings.

- 3.3. When the Intercom has completed the initialization process, press and hold the RTFM switch (SW1 button) for 3 seconds to announce the IP address.

This concludes the power test. Go to [Section 4.0, "InformaCast Configuration File Retrieval"](#).

---

## 4.0 InformaCast Configuration File Retrieval

4.1. **DHCP should be enabled.** After the device initializes, it will send a broadcast to the DHCP server to ask for the location of its **InformaCastSpeaker.cfg** configuration file.

4.2. SLP or TFTP?

- **SLP** should be enabled on InformaCast version 5.0.4 or higher. SLP is an InformaCast protocol introduced in InformaCast version 5.0.4. The device will retrieve its configuration file from an InformaCast server folder specified by SLP. SLP method is preferred.
- **TFTP** servers may be used instead of SLP. In this alternate scenario, DHCP option 150 is required to provide the device with the address of the TFTP server. Otherwise, the device will be unable to retrieve its configuration file.

**Note** The device and InformaCast server should be on the same subnet during the device's initial configuration if it cannot access the VLANs upon which the InformaCast Server and DHCP servers are located. It may be necessary to manually configure your switch port to allow access to the VLAN.

---

## 5.0 Singlewire-Enabled Singlewire InformaCast Indoor Intercom, Flush Mount Identification and Testing

5.1. Ensure the InformaCast Server has detected a new device.

5.2. Test the newly detected device.

5.3. Add the newly detected device to the InformaCast Server.

---

## 6.0 Contacting CyberData VoIP Technical Support

We encourage you to access our Technical Support help desk at the following address:

<http://support.cyberdata.net/>

**Note** You can also access the Technical Support help desk by navigating through menus on the CyberData website ([www.CyberData.net](http://www.CyberData.net)) as shown in the following figure:

The Technical Support help desk provides the options of accessing documentation for your CyberData product, browsing the knowledge base, and submitting a troubleshooting ticket.

Please be advised requests for Returned Materials Authorization (RMA) numbers require an active VoIP Technical Support ticket number. A product will not be accepted for return without an approved RMA number.
